Short Description of the Demonstration

This Demonstration plots a network encoding musical instruments used for rhythm accompaniment. The data consist of 100 recordings of 21 popular songs of Smyrna in nine-beat rhythms. The user can select various measures. The results are also presented as tables and scatter plots.

Details

The following rhythm accompaniment musical instruments were considered: guitar, toumperleki, spoon drums, bendir, baglamas, contrabass, oud, harpsichord, glass, zil, tambourine, lute, maracas, davul, saz, zither, bendir with zil (bendir-zil), drums, castanets, accordion, kompoloi with a glass (kompoloi-glass), synthesizer, tabla, crotalums, ney, electric guitar, and triangle, and voice.

The network encodes the use of these musical instruments in the recordings, either alone or in combination. Each vertex of the network represents an instrument. If an instrument was used alone, it is connected to itself with a loop. If it was used in combination with any other instruments, it is connected to each of them with an edge. The network is weighted. The weight of each loop or edge is the frequency of use for each instrument or combination of instruments in the recordings. The area of each highlighted vertex is proportional to its respective measure. The calculated measures are the valences, the closeness, betweenness centrality, degree, radiality, eccentricity, hub, authority centrality, eigenvector centrality, status centrality, page rank centrality, local clustering coefficients and mean neighbor degrees.

To the best of our knowledge, this Demonstration presents a novel method for studying the characteristics of musical instruments.
